dx	$= 15e-3;$
dy	$= 15e-3;$
w	$= 1e-3;$
l	$= 14e-3;$

dx	$= 20e-3;$
dy	$= 20e-3;$
w	$= 1e-3;$
l	$= 14e-3;$

For a fixed frequency (10 GHz), plot Z_{in} as a function of the angle for E H and D plane

- How does the impedance change with the angle in the E and H plane? Why?
- What type of singularities appear in the active input impedance?
- For scanning in each plane, sketch the grating lobe diagram to explain which modes enter the visible region
